

Abstract of the Disclosure

A hinge part (3) includes a first hinge part (1f) as a fitted part, which is formed by cutting out one of side parts of a first housing (1), and a second hinge part (32a), (3b), which is a fitting part protruded from one of the side parts of an inner surface (2A) of a second housing (2) toward an inner surface (1A) of the first housing (1), and rotatably engages with the first hinge part (1f), wherein the first hinge part (1f) and the second hinge part (32a), (3b) are not bulged out of the inner surface of the first housing (1). With such a mechanical arrangement, when the first housing (1) is placed on a work surface and the second housing (2) is opened, the side part of the first housing (1) which is closer to the a first hinge part (1f) is raised.
